

Scatter plot showing Spearman correlation between proxy and reference decision accuracy for different proxy sizes. The x-axis is 'Spearman ρ with decision accuracy (proxy vs reference)' ranging from -0.6 to 0.8. The y-axis represents different proxy sizes: 90M, 175M, 350M, 600M, and 1B. Data points are colored circles representing different proxy sizes, with sample size 'n' labeled next to each. A vertical line is at x=0. The plot shows that for larger proxy sizes, the correlation is generally positive and higher, while for smaller proxy sizes, the correlation is closer to zero or slightly negative.

Proxy Size	Sample Size (n)	Spearman ρ
1B proxy	1286	0.55

Scatter plot showing Spearman ρ with decision accuracy (proxy vs reference) for $n=50$. The x-axis ranges from -0.6 to 0.8. A vertical line is at 0.0. Data points are colored blue and light blue, with labels 'n=50' next to them. Most points are clustered around 0.0, with some outliers at negative and positive values.
